

**Warning: Always check for underground cables or services**

## Installation Guide

Build your timber frame using 2 inch wide timbers  
Top Tip: 100mm x 50mm timber are perfect

Attach the brackets to your frame  
Spin the bearing plates onto the screw piles  
and attach the screw piles to the brackets  
Spin the plates to their starting position  
next to the brackets

Flip the frame over and position  
(Tip: Make sure that the screw piles are vertical &  
that the ground where the screw piles  
are positioned is flat and compacted)

Drive the piles into the ground  
to the desired depth by tapping the timbers  
(Tip: If your ground is hard, make life easy by pre-drilling your  
holes with a 20mm bit. Simply mark where your screw piles  
will go and drill down 25cm)

Use a spanner to spin the bearing plates  
up or down the screw piles to level your frame  
Up to 6 inches of adjustment  
available for uneven sites

Attach your floor and build your shed
